**from the handbook
of medical
library practice:**

"Regardless of its size, a library needs indexing and abstracting journals. These are the keys to the literature both to what is in the collection and even more important, to the material that is outside the collection, but still of interest to the reader. Some of these tools are expensive, but are valued in terms of the literature they make available and the time and effort they serve. Medical libraries will want to subscribe to all, or some parts of Excerpta Medica. This monthly English-language abstracting series, published in thirty-nine subject sections, is valuable for its broad coverage of the medical literature of the world and for the access it gives to journals in foreign languages."

PATIENT MONITORING

J. F. Crul and J. P. Payne

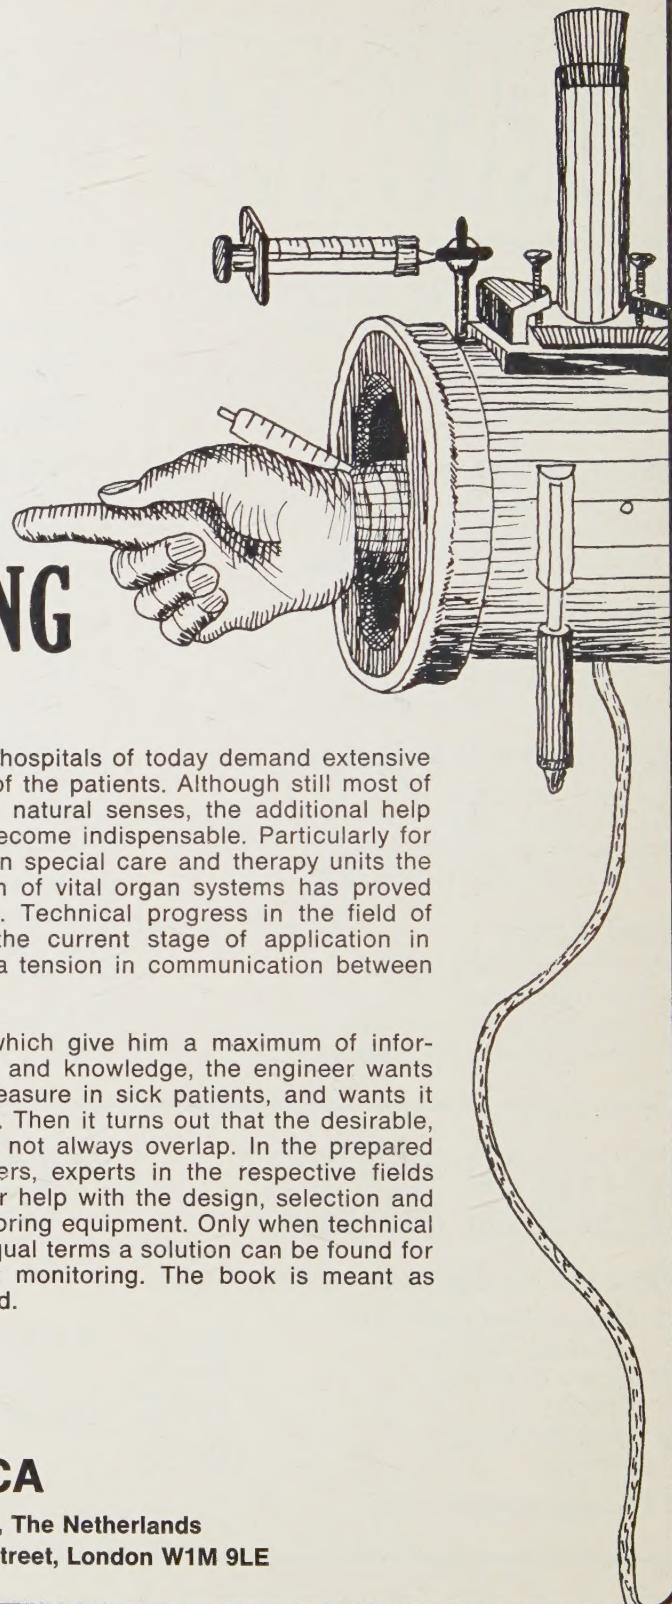

Medical and nursing care in the hospitals of today demand extensive information about the condition of the patients. Although still most of it is collected by the use of the natural senses, the additional help offered by instrumentation has become indispensable. Particularly for patients under anaesthesia and in special care and therapy units the continuous electronic supervision of vital organ systems has proved beneficial and saved many lives. Technical progress in the field of instrumentation is far beyond the current stage of application in patient monitoring. This causes a tension in communication between doctors and engineers.

The doctor wants instruments which give him a maximum of information with a minimum of effort and knowledge, the engineer wants to know what is important to measure in sick patients, and wants it translated into his own language. Then it turns out that the desirable, the possible and the admissible not always overlap. In the prepared monograph doctors and engineers, experts in the respective fields of monitoring, together offer their help with the design, selection and use of general and special monitoring equipment. Only when technical and medical sciences meet on equal terms a solution can be found for this intricate problem of patient monitoring. The book is meant as a guide for all involved in this field.
